What are Data Structures?

Data Structure¹

A way in which data are stored for efficient search and retrieval.
Different data structures are suited for different problems.

- ▶ Data type \neq data structure
- ▶ `java.util.HashSet` vs. hash table
- ▶ array vs. array

Linked List

Definition

A linked list is a data structure in which the objects are arranged in a linear order. Unlike arrays in which the linear order is determined by indices, the order is determined by a pointer in each object.⁴

- ▶ Different types: singly, doubly, multiply, circular, ...
- ▶ Example: doubly linked list

Hash Table

Definition

A dictionary in which keys are mapped to array positions by hash functions.⁵

- ▶ Hash functions: determinism, uniformity, defined range, data normalisation, non-invertible, perfect, . . .
- ▶ Collisions resolution: chaining, open addressing, . . .
- ▶ Example:

Tree

Definition

A data structure made up of nodes or vertices and edges without having any cycle. A tree that is not empty consists of a root node and potentially many levels of additional nodes that form a hierarchy.

- ▶ Depth, binary, (nearly) complete, ...
- ▶ Example:

Binary Heap

Definition (Heap)

A complete tree where every node has a key more extreme (greater or less) than or equal to the key of its parent.⁶

Definition (Binary Heap)

A binary heap data structure is an array object that we can view as a nearly complete binary tree that satisfies the min-heap or max-heap property.⁷

Binary Max-Heap

- ▶ $\text{Parent}(n) \quad \lfloor \frac{n-1}{2} \rfloor$
- ▶ $\text{Left}(n) \quad 2n + 1$
- ▶ $\text{Right}(n) \quad 2(n + 1)$
